

Culligan Brings Out the Best in Water

Culligan knows the science of water. Since 1936, Culligan has continually developed new technologies to treat hard water and rid water of contaminants. Culligan's high-quality water treatment products have been perfected through research and development, and are used by homes and businesses worldwide.

The Culligan team traditionally had outsourced its design files to several service providers to develop parts, allowing them to verify engineering design. But this process proved slow and costly.

The team also frequently received requests from the Culligan marketing group to generate prototypes that could be used to show the company's franchisees and dealer network potential product ideas. Due to the time and cost involved in outsourcing, Culligan lost a measure of flexibility in communicating with its sales channels.

"Our experience with outside service providers was mixed," said Steve Reif, director of research and development engineering for Culligan. "It sometimes took several days or weeks to receive a part, slowing down our product development and design verification processes. We needed more immediate results than these companies could provide, and at a much lower cost."

"I wouldn't trade in our Dimension 3D printer for anything. It's a tool we use to showcase our capabilities when our dealers and resellers come into the office for a tour. They are always very impressed."

— Steve Reif
Director of Research &
Development,
Culligan

The Dimension Solution

Culligan selected a Dimension BST 3D Printer, which is a networked desktop modeling system that builds functional 3D models with durable ABS plastic from the bottom up, one layer at a time.

Reif and his team have realized tremendous cost savings with the printer. In one instance, the team was able to quickly identify potential interference issues with several product parts, a task not always accomplished simply by examining the 3D CAD file.

“We primarily use the printer to verify form and fit of our product designs, speeding up the product development cycle. In addition, we’ve also been making parts with the printer that we put into use. We’ll piece together a sample product using the ABS plastic parts, and actually run water through the prototype to verify function.”

— Steve Reif

An essential tool for everyone on the design team. Dimension 3D printing can help you quickly fine tune designs and cut weeks – even months – from your development schedule. Now you can test form, fit and function and explore as many design iterations as you like – over your network, right from your desktop.
